Series Solutions of Linear Differential Equations

5.1.2 Power Series Solutions

A Definition Suppose the linear second-order differential equation

$$a_2(x)y'' + a_1(x)y' + a_0(x)y = 0 (5)$$

is put into standard form

$$y'' + P(x)y' + Q(x)y = 0 ag{6}$$

by dividing by the leading coefficient $a_2(x)$. We make the following definition.

Analytic at a Point A function f is analytic at a point a if it can be represented by a power series in x - a with a positive radius of convergence.

Definition 5.1.1 Ordinary and Singular Points

A point x_0 is said to be an **ordinary point** of the differential equation (5) if both P(x) and Q(x) in the standard form (6) are analytic at x_0 . A point that is not an ordinary point is said to be a **singular point** of the equation.

Theorem 5.1.1 Existence of Power Series Solutions

If $x = x_0$ is an ordinary point of the differential equation (5), we can always find two linearly independent solutions in the form of a power series centered at x_0 ; that is, $y = \sum_{n=0}^{\infty} c_n (x - x_0)^n$. A series solution converges at least on some interval defined by $|x - x_0| < R$, where R is the distance from x_0 to the closest singular point.

$$\frac{1}{1-x} = \sum_{m=0}^{\infty} x^m = 1 + x + x^2 + \longrightarrow (|x| < 1, \text{ geometric series})$$

$$e^x = \sum_{m=0}^{\infty} \frac{x^m}{m!} = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \longrightarrow$$

$$\cos x = \sum_{m=0}^{\infty} \frac{(-1)^m x^{2m}}{(2m)!} = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - + \xrightarrow{\infty}$$

$$\sin x = \sum_{m=0}^{\infty} \frac{(-1)^m x^{2m+1}}{(2m+1)!} = x - \frac{x^3}{3!} + \frac{x^5}{5!} - + \longrightarrow$$
